3.4. α -Glucosidase inhibition assay

The α -glucosidase inhibition activity was performed with slight modifications [43]. A total volume of 100 μ L reaction mixture contained, 70 μ L 50 mM phosphate buffer pH 6.8, 10 μ L (0.5 mM in methanol) test compound, followed by the addition of 10 μ L (0.057 units, Sigma Inc.) enzyme solution in the buffer. The contents were mixed, pre-incubated for 10 min at 37 °C and pre-read at 400 nm. The reaction was initiated by the addition of 10 μ L of 0.5 mM substrate (p-nitrophenyl glucopyranoside, Sigma Inc.). After 30 min of incubation at 37 °C, the absorbance of p-nitrophenol was measured at 400 nm using the Synergy HT 96-well plate reader, BioTek, USA. Acarbose was used as positive control. All experiments were carried out in triplicates (mean \pm SEM, n = 3). Percent inhibition was calculated by the following equation: Inhibition (%) = (Abs of Control-Abs of Test/Abs of Control) \times 100 Active compound solutions were

suitably diluted and their inhibition studies were determined. Data obtained was used for the determination of IC₅₀ values (concentration at which there is 50 % enzyme inhibition) using EZ-Fit Enzyme Kinetics Software (Perrella Scientific Inc. Amherst, USA).

3.5. α -Amylase inhibition assay

The α -amylase inhibitory activity was determined by an assay modified from Kwon, Apostolidis and Shetty. A volume of 500 mL of α -amylase solution (0.5 mg/mL) in 0.2 mM phosphate buffer (pH 6.9) and 500 mL of test sample (100, 200, 400, 800, 1000 mg/mL) were incubated for 10 min at 25°C. After pre-incubation, 1% starch solution (500 mL) in 0.02 M sodium phosphate buffer (pH 6.9) was added to each tube and incubated at 25°C for 10 min. 1mL of dinitrosalicylic acid color reagent was then added to the reaction mixture and the tubes were incubated in boiling water for 5 min, and finally cooled to room temperature. The solutions were diluted by adding 10mL distilled water and the absorbance was measured at 540 nm [44]. The percentage inhibition was calculated as illustrated in given formula.

$$\% \text{inhibition} = (\text{Absorbance}_{\text{control}} - \text{Absorbance}_{\text{sample}}) / \text{Absorbance}_{\text{control}} \times 100$$
