

Figure S1 – Cytosolic folding stress evaluation in *gun1* mutant background. Measurements of proteasome activity (**A**). Immunoblot showing FTSH5 accumulation in wild-type and *gun1* genetic background grown in control condition (C), after 3 h recovery from heat shock (R) and in presence of 550 μM lincomycin (Lin) (**B**). Mature form and precursor bands are indicated by black or white arrowheads, respectively. The CBB-stained gel is shown as a loading control.
