2 Supplementary Figures

Supplementary Figure S1. Whole-cell reductive amination of vanillin to vanillylamine in flasks (aerobic) or sealed serum vials (anaerobic) and various conditions using yeast strain TMB4375 overexpressing Cv-ATA in (A) glucose, aerobic, (B) ethanol, aerobic, (C) glucose, anaerobic, (D) ethanol, anaerobic. Vanillin consumption rate was (A) 0.08 ± 0.00 , (B) 0.11 ± 0.00 , (C) 0.04 ± 0.01 and (D) 0.02 ± 0.01 , calculated for the initial 6 hours as milimoles of vanillin consumed per cell concentration in OD and time ($\text{mmol OD}^{-1} \text{ h}^{-1}$).

Supplementary Figure S2. Anaerobic whole-cell reductive amination of vanillin to vanillylamine in flasks with co-substrate (A) glucose or (B) ethanol, using yeast strain TMBNM032 overexpressing Cv-ATA and Bs-AlaDH. Vanillin consumption rate was (A) 0.07 ± 0.01 and (B) 0.04 ± 0.01 , calculated for the initial 6 hours as milimoles of vanillin consumed per cell concentration in OD and time (mmol $\text{OD}^{-1} \text{ h}^{-1}$).

Supplementary Figure S3. Optical density and percentage of intact cells from whole-cell bioreactor bioconversions by TMBNM034 in (A) 0.5 vvm aerated and (B) no aerated condition.
