

Supplemental Figure 1

Suppl. Figure 1. Hemodynamic parameters after 4 hours of ventilation. (A) Mean arterial pressure (MAP): Low tidal volume (LVT) ventilation + lisinopril (lisi) infusion substantially decreased the MAP shown here as a negative Δ MAP (= MAP at 4 hours – MAP at baseline), which was prevented by additional treatment with ALT-00 at 2.7, 10 and 100 μ g/kg/min. $n = 14/14/13/4/4$ /group respectively, *** $p < 0.001$ compared by one-way analysis of variance with Tukey posttest.
