

SUPPLEMENTARY MATERIAL

Models of the associations between each preoperative SBP dynamical metric and ICU LOS analyzed both as a continuous (Table A) and as binary variable (Table B) are presented below for the entire study cohort, which includes patients with paroxysmal or persistent atrial flutter or atrial fibrillation during final preoperative preparation ($n = 44$), electronic pacemaker ($n = 10$) and those ($n = 9$) who died within 30 days of surgery given that 33% of them (3 out of 9) had a “misleadingly” short (≤ 2 days) ICU LOS.

Table A. Unadjusted and adjusted linear regression analysis of the associations between each preoperative SBP dynamical metric and postoperative number of hours in the ICU.

A. Sub-group with STS ($N = 389$)

EuroSCORE II (%)	0.31	0.21	0.41	< 0.001	0.092										

The values shown are the regression coefficients (β) and 95% CIs for standardized variables. Separate models were fitted for each of the different BPV indicators. The adjustments were age and sex in Model 1, and STS or EuroSCORE II in Model 2. Statistically significant P values are highlighted in bold. Abbreviations: ARV, average real variability; BPF, blood pressure fragmentation; CI, confidence interval; CV, coefficient of variation; DFA, detrended fluctuation analysis; EuroSCORE, European System for Cardiac Operative Risk Evaluation; ICU, intensive care unit; LOS, length of stay; SBP, systolic blood pressure; SD, standard deviation; and STS, Society of Thoracic Surgeons.

Table B. Unadjusted and adjusted modified Poisson regression analyses of the associations between each preoperative SBP dynamical metric and long ICU LOS.
