

Supplementary Table 4. Linkage disequilibrium (r^2) between pairwise combinations of significant SNPs according to Bonferroni threshold at 5% and, if not included, the first SNP on the opposite side of the cloned gene for each of seven pea qualitative traits (flower pigmentation includes SNPs for both standard pigmentation and keel and wing pigmentation). Although not significant, the SNP featuring the lowest p value for cotyledon color was included due to its proximity to the significance threshold. Significant SNPs were identified by a GWAS based on 41,114 SNPs performed on a worldwide germplasm collection of 220 landraces from 19 regional pools and 11 modern cultivars.
