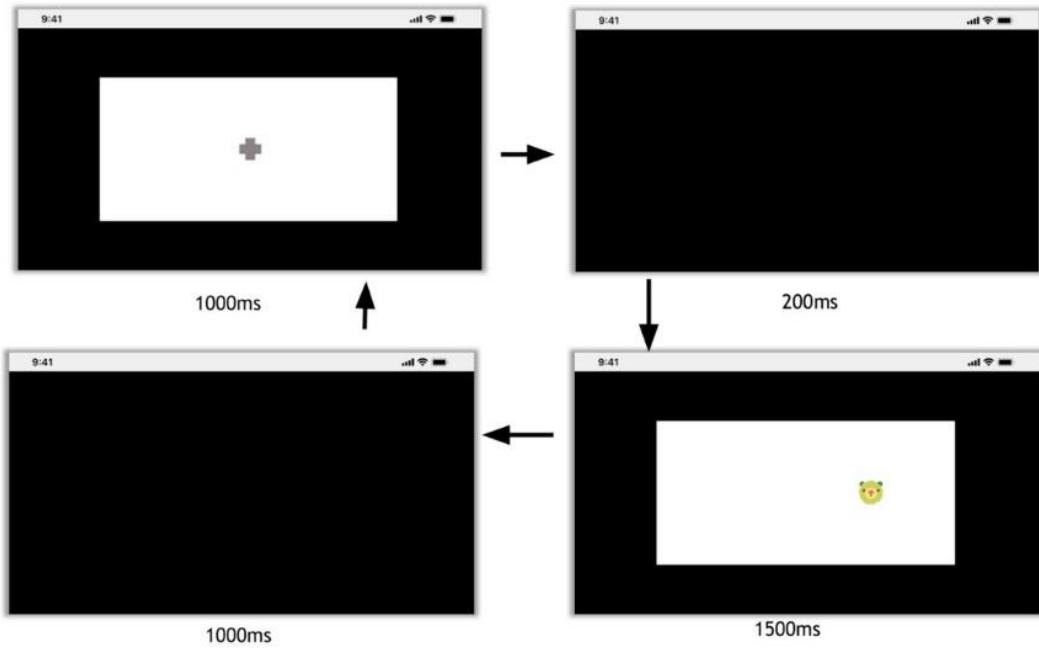

Figure S1. The procedure of the pro-saccade task (PST)

Participants first focused on a central fixation point (FP) and then shifted their gaze to a peripheral target stimulus that appeared unpredictably on the left or right side of the Smart Pad device. After 1,000 ms, the FP disappeared, followed by the appearance of an eccentric target stimulus that was illuminated for 1,000 ms.

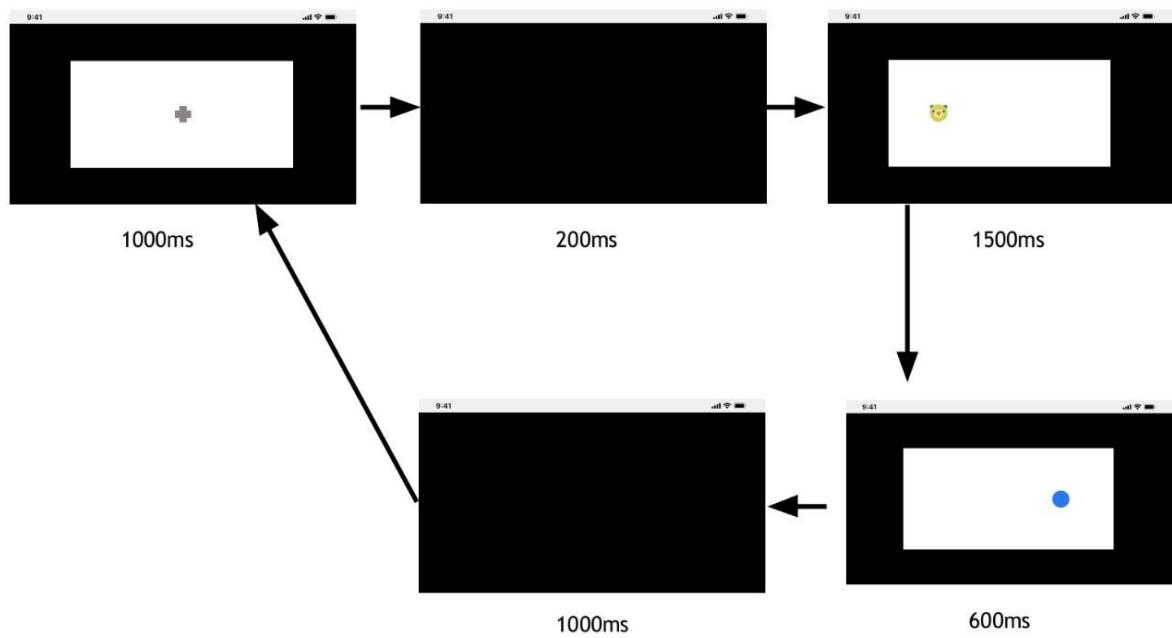

Figure S2. The procedure of the anti-saccade task (AST)

Participants directed their gaze to the central FP and, upon appearance of the eccentric stimulus, shifted their gaze away from it to the opposite side of the vertical meridian. This anti-saccade task consisted of 48 trials, 5 s apart.

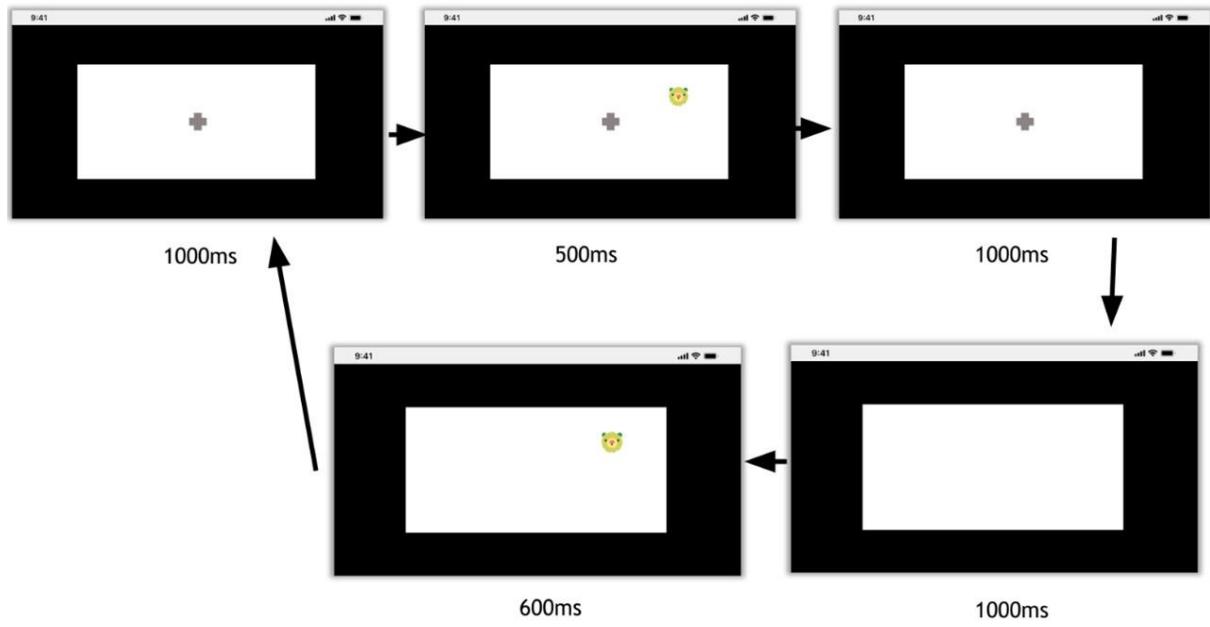

Figure S3. The procedure of the Memory-guided saccade task (MGST)

Participants first focused on the FP for 1,000 ms before a target stimulus briefly appeared in the peripheral region of the screen (500 ms). After the FP disappeared, participants had to remember the location and move their gaze to it in the absence of a visual cue. Stimulus locations were randomized across trials in the 36-trial.

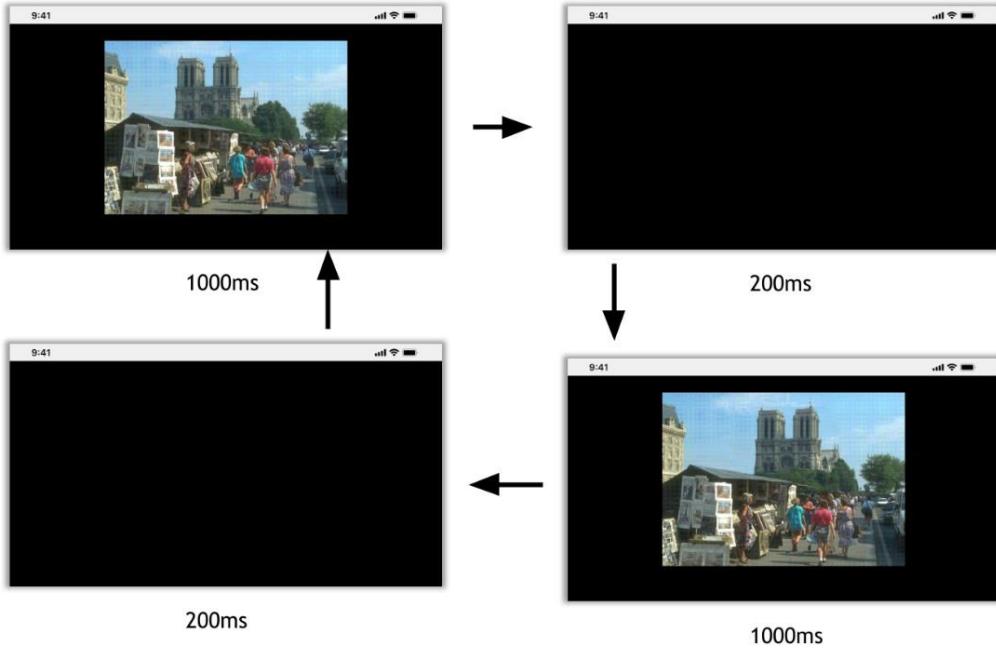

Figure S4. The procedure of the Change detection task (CDT)

The CDT consisted of 15 pairs of images presented sequentially with small differences. Participants had 240 ms to identify differences by touching the location they judged to be different and then moving on to the next pair, with incorrect responses moving on to the next pair after 20 seconds.

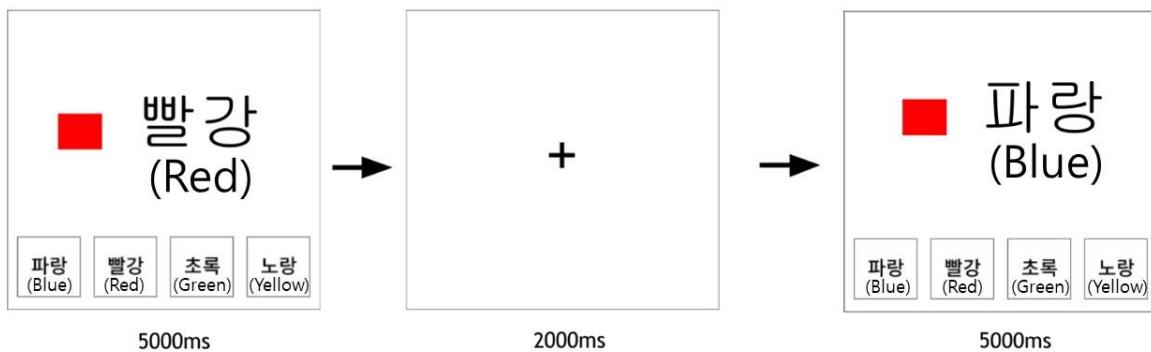

Figure S5. The procedure of the Stroop task

Participants were asked to identify colors presented in rectangles with corresponding color names. They completed 40 trials, discriminating between congruent and incongruent stimuli within 5,000 ms, followed by 2,000 ms of FP indicating trial changes. Incorrect responses led them to the next trial after 5 seconds.
