Table S4, continued

Proteins tested in our study	Residues showed nuclear targeting activity	Predicted NLS		
		pSORT II	NLStradamus	cNLS mapper
PHYSO_533817	172-314	pat4, 33-PRRR-36 pat4, 34-RRRR-37 pat4, 216-RKRH-219 pat4, 279-RKRK-282 pat7, 31-PDPRRR-37 pat7, 33-PRRRVL-39	2s, 2d, 278-SRKR-281 4d, 277-KSRKRK-282	monopartite, 276-RKSRKRKAESE-286 (14.0) 426-RSAKRKCATCSREF-440 (5.0) 426-RSAKRKCATC-436 (6.0) bipartite, 189- RALSAGLKLHRQVDNVSDAKFGLYERKRHQN -221 (6.4) 275- ERKSRKRKAESLPLEFACTQCERSFKSAQG- 305 (8.7) 275- ERKSRKRKAESLPLEFACTQCERSFKSAQGL- 306 (5.3)

¹. I, incomplete nuclear localization (GFP signal is visible in the cytoplasm, approximately 1<LNC<3).

². *PSORTII* differentiates monopartite and bipartite cNLSs. The detection and classification of monopartite cNLSs is based on two rules: pat 4, 4 residue pattern, which composes of 4 basic amino acids (K or R), or composed of three basic amino acids (K or R) and either H or P. pat 7, 7 residue pattern, which start with P and followed within 3 residues by a basic segment containing 3 K/R residues out of 4. Ref. PSORT, (1997).

³. NLStradamus does not classify NLS types. The NLS prediction is based on three hidden markov models (HHM). 2s, 2 state HHM static; 2d, 2 state HHM dynamic; 4s, 4 state HHM static. Ref. Ba et al, (2009).

⁴. *cNLS Mapper* generates and distinguishes monopartite and bipartite cNLSs. The predictions shown are based on a cut-off score, 5.0 (a candidate protein fused reporter localizes to both the nucleus and the cytoplasm). Score for each predicted NLS is shown in a parenthesis at the end of the sequence. Ref. Kosugi et al., (2009).
