FIGURE S1 | Development of the marker *Xtamyc1* for amplifying the two different alleles of *TaMYC1* (*TaMYC1p* and *TaMYC1w*). The fragments yielded by the marker were either 2163 or 1151 bp, which were indicative of *TaMYC1p* and *TaMYC1w*, respectively. The amplification results for two common wheat cultivars (Gaoyuan 115 and Opata) and three derivative recombinant inbred lines (RILs) were shown. The size (bp) of the DNA standards is shown on the left side of the graph.

TABLE S1 | Molecular characteristics and relative abundance of the six transcript isoforms of *TaMYC1* found in the pericarp tissues of the purple-grained wheat Gaoyuan 115^{a,b}.

	Isoform I	Isoform II	Isoform III	Isoform IV	Isoform V	Isoform VI
Open reading frame (ORF, bp)	1566	1635	1707	1741	1743	1798
Relative abundance ^a	4 (2.0%)	15 (7.5%)	174 (86.6%)	2 (1.0%)	2 (1.0%)	4 (2.0%)
Polypeptide deduced (aa) ^b	521	544	568	407	580	548

^a The relative abundance of the six isoforms was estimated by cloning the RT-PCR products, sequencing 201 randomly picked positive clones, and counting the number of clones carrying the cDNA of a given transcript isoform.

^b Each polypeptide was deduced from the corresponding ORF through conceptual translation. The six polypeptides differed in the number of amino acids (aa) because of the presence of indels and/or premature stop codon in their ORF.

TABLE S2 | The anthocyanin contents among the developing grains of mock controls and the plants infected by BSMV:GFP or BSMV:TaMYC1as^a.

Mock	24.03	7.71
BSMV:GFP	25.99	10.81
BSMV:TaMYC1as	7.51	3.89

^a The three sources of grains were individually assayed for anthocyanin content, with the averaged values (means \pm SE, n = 20) being compared statistically. The means marked by different letters are statistically significant ($P < 0.05$). The data shown were reproducible in another two separate determinations.

^a The homologous sequences of the 261 nt element were searched using BlastN in four public nucleic acid and genomic databases, i.e., NCBI (<https://blast.ncbi.nlm.nih.gov/>), JGI (<https://phytozome.jgi.doe.gov/>), UIGI (<https://urgi.versailles.inra.fr/>) and IPK (<http://webblast.ipk-gatersleben.de/barley>). The homologs of the 261 nt element were found in only Triticeae species (i.e., barley, wheat and related *Aegilops* species), but not in the remaining 52 plant species (including rice, maize and *Brachypodium distachyon*) in JGI, even though the homologous sequence of *TaMYC1* coding region could be detected in these plants. The homologs of the 261 nt element were present exclusively in the promoter region of predicted bHLH TF genes in the concerned Triticeae species, and their copy numbers varied from one to two. “Accession” means the contig name. “Identity” indicates number of identical matches/alignment length. “Percentage of identity” means percentage of identical matches. “Start” means the beginning position of matches in the contig, while “End” means the final position of the matches in the contig.
