Supplementary Table 2. Statistical analysis (ANOVA/Tukey-Kramer) of growth parameters of wild-type and mutant plants. (A) Growth rates of leaf rosettes were determined for plants grown in soil at a PFD of 150 $\mu\text{mol}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$ in the long-day (Supplementary Figure 6A and B). **(B)** For the determination of photosynthesis parameters three week old soil-grown plants were dark-adapted for 30 min. Photosynthesis was induced with actinic light at a PFD of 164 $\mu\text{mol}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$. Relative $\text{ETR}_{(800)}$ was determined from light curves at a PFD of 800 $\mu\text{mol}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$ (Table 2, main article; Supplementary Figure 6). The biotypes are denoted, **a** = Col-0, **b** = *ppt2-1*, and **c** = *ppt2-2*. The significance levels of $P < 0.05$ or $P < 0.01$ are indicated by light or dark blue colors.

Supplementary Table 3. Statistical analysis (ANOVA/Tukey-Kramer) of growth, photosynthesis, and leaf parameters in wild-type and mutant plants. (A) Growth parameters of rosette leaves were assessed of plants grown in soil under long-day conditions at a PFD of 150 $\mu\text{mol}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$ (see Figure 6D, main article). Generative growth parameters are contained in Table 3 (main article). Chl fluorescence parameters (B) and leaf composition (C) contained in Table 4 (A and B; main article) and for non-photochemical quench parameters in Supplementary Figure 8. The biotypes are denoted, **a** = Col-0, **b** = Ws-2, **c** = *xpt-1*, **d** = *cue1-6*, **e** = *ppt2-1*, **f** = *cue1-6/ppt2-1*, **g** = *cue1-6/xpt-1*, and **h** = *cue1-6/ppt2-1/xpt-1*. DAS = days after sowing. The significance levels of $P < 0.05$ or $P < 0.01$ are indicated by light or dark blue colors.
