1. Adult liver cancers were defined according to the International Classification of Disease for Oncology, Third Edition (ICD-O-3) or International Classification of Disease, Tenth Edition (ICD-10) site code (C22).
2. Annual percentage change in age-standardized rates determined using JoinPoint regression except for four studies (8, 9, 21, 24) that used Poisson modelling and two studies (17, 39) that used age-period-cohort methods.
3. Trends based on annual percentage change (APC) in age-standardised incidence rate. The APC is the annual increase or decrease in incidence trends over the specified time period.
4. Negative APC values indicate a decreasing trend whereas positive APC values indicate an increasing trend. Stable means that the 95% confidence interval does not include zero.
5. Only incidence trends for most recent time period shown.
6. Based on population-based cancer incidence data from the United States Cancer Statistics registry for all 50 states in the USA and the District of Columbia.
7. Based on population-based cancer incidence data from the North American Association of Central Cancer Registries database for 47 states and the District of Puerto Rico in the USA.
8. Studies did not report the 95% confidence intervals and were not included in the meta-analysis.
9. Findings were significant at 5% level.
10. Based on population-based cancer incidence data from the North American Association of Central Cancer Registries database for 25 states in the USA.
11. Study not included in meta-analysis as trends only reported by smaller age-groups.
12. Based on population-based cancer incidence data from the North American Association of Central Cancer Registries database for 24 states and one metropolitan area (Atlanta) in the USA.

1. Adult hepatocellular carcinomas (HCC) were defined according to the International Classification of Disease for Oncology, Third Edition (ICD-O-3) site code (C22.0) and histologically as HCC (ICD-O-3 morphology codes M8170-M8175).
2. Annual percentage change in age-standardized rates determined using JoinPoint regression except for three studies (2, 10, 41) that used Poisson modelling and one study (28) that used age-period-cohort methods.
3. Trends based on annual percentage change (APC) in age-standardised incidence rate. The APC is the annual increase or decrease in incidence trends over the specified time period.
4. Negative APC values indicate a decreasing trend whereas positive APC values indicate an increasing trend. Stable means that the 95% confidence interval does not include zero.
5. Only incidence trends for most recent time period shown.
6. Based on population-based cancer incidence data from the Surveillance, Epidemiology and End Results (SEER 18) database covering 11 states and two metropolitan areas in the USA.
7. Findings were significant at 5% level.
8. Based on population-based cancer incidence data from the Surveillance, Epidemiology and End Results (SEER 13) database covering six states and seven regions in the USA.
9. Also gives trends by smaller age group and ethnicity.
10. Based on data from the Surveillance, Epidemiology and End Results/Medicare linked database.
11. Not included in meta-analysis as trends only reported for population sub-groups.
12. Based on population-based cancer incidence data from the United States Cancer Statistics registry for all 50 states and the District of Columbia in the USA.
13. Only people infected with viral hepatitis B (HBV+) or viral hepatitis C (HCV+).
