Table S1

Descriptive Statistics

S.D.: Standard deviation, BDI: Beck Depression inventory, HAM-D: Hamilton Depression scale, MADRS: Montgomery–Åsberg Depression Rating Scale, EPI: Eysenck Personality Inventory, ERQ: Emotion Regulation Questionnaire, CTQ: Childhood Trauma Questionnaire
Indicated are demographical facts as well as mean questionnaire scores of all participants, as well as divided into subgroups of responders and non-responders.

There were no significant differences between responders and non-responders regarding the results of EPI, ERQ, or CTQ.

¹ 5-9 none to minimal, 10-14 low to moderate, 15-17 moderate to severe, ≥ 18 severe to extreme

² ≥ 5 none to minimal, 6-7 low to moderate, 8-12 moderate to severe, ≥ 13 severe to extreme

³ 5-7 none to minimal, 8-9 low to moderate, 10-12 moderate to severe, ≥ 13 severe to extreme

⁴ 5-8 none to minimal, 9-12 low to moderate, 13-15 moderate to severe, ≥ 16 severe to extreme

Table S2**Paired sample T-Test for depression**

T1: pre-treatment, T6: post-treatment, S.D.: Standard deviation, Std.: standard, C.I.: Confidence Interval, *t*: *t*-value, df: degrees of freedom, Sig.: significance (2-tailed), BDI: Beck Depression inventory, HAM-D: Hamilton Depression scale, MADRS: Montgomery–Åsberg Depression Rating Scale,

Presented are the results of paired sample T-Tests for pre- and posttreatment depression first for the whole sample, demonstrating a significant reduction of scores after treatment, as well as for the group of responders and non-responders on their own.

	Mean	S.D.	Std. Error Mean	95% C.I. of the Difference		t	df	Sig.
