

Supplemental Figure 2. Hypocotyl lengths of *rgv* mutants.

Hypocotyl lengths of 4-d-old seedlings grown in the dark (Dc), blue light (Bc; 1 $\mu\text{mol}/\text{m}^2\text{s}$), or red light (Rc; 20 $\mu\text{mol}/\text{m}^2\text{s}$) were measured. Letters indicate statistical significance determined by an ANOVA with Tukey's HSD post-hoc test for multiple comparisons ($p < 0.01$). Error bars=SEM (n = 15).
