Left middle temporal gyrus	-65	-20	-10
Right middle temporal gyrus	65	-20	-10

Supplementary Table 1: Seed coordinates used for functional connectivity analysis.*

*The eLORETA solution space was restricted to the cortical gray matter of a realistic head model (MNI152), co-registered to the Talairach brain atlas and digitized at the Montreal Neurologic Institute (MNI) brain imaging center. A single voxel that was closest to the seed point was defined as the centroid of each region of interest (ROI).

Supplementary Table 7. Contrasts examining the effect of *Time* on eLORETA resting state functional connectivity for the RSL (n = 23) and COCKTAIL (n = 20) experiment.^{*}

*Connectivity was defined as the lagged phase synchronization between the intracortical EEG-source estimates of the regions of interest. $t_{critical}$, critical probability threshold of non-parametric randomization test with 5000 randomizations corrected for multiple comparisons; t_{max} , maximal t-statistic; $p_{corr.}$, p-value.

Supplementary Figure 1. Impact of long-duration head-down tilt bed rest on normalized electrocortical activity for the RSL study (n = 23, blue circle), and the COCKTAIL study (N = 20, black square). Time courses show changes of EEG spectral power after z-transforming across study participants and testing days for anterior and posterior sites, within the (A) theta, (B) delta, (C) alpha, and (D) beta frequency. Data are presented for each time point as estimated marginal means and standard errors. Significant levels with respect to baseline are indicated by asterisks. BDC-10 to BDC-1 refers to baseline data collection. HDBR1, HDBR30, and HDBR60 indicate first, 30th, and 60th day of HDBR. R+0 to R+10 correspond to the first and 11th day after HDBR. For RSL data were collected at BDC-7, HDBR2, HDBR28, HDBR56, and R+10. For COCKTAIL data were collected at BDC-8, HDBR7, HDBR30, HDBR60, and R+7. *p < 0.05, **p < 0.01, and ***p < 0.001 compared to baseline.
