

A. DeoR family

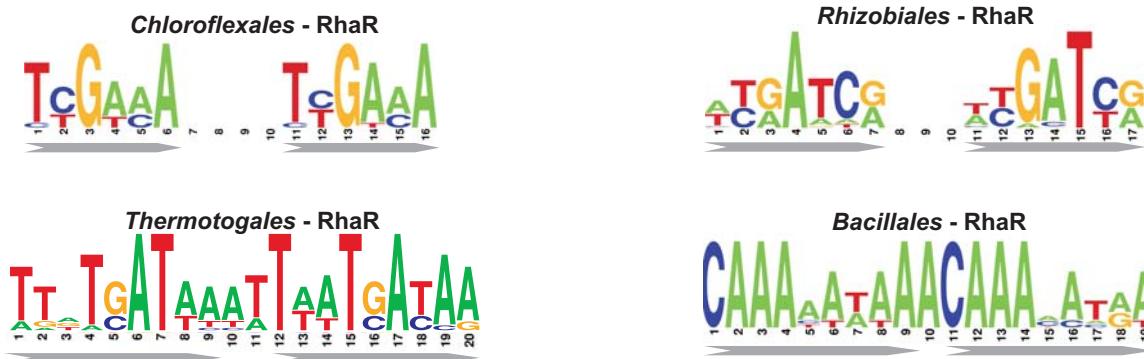

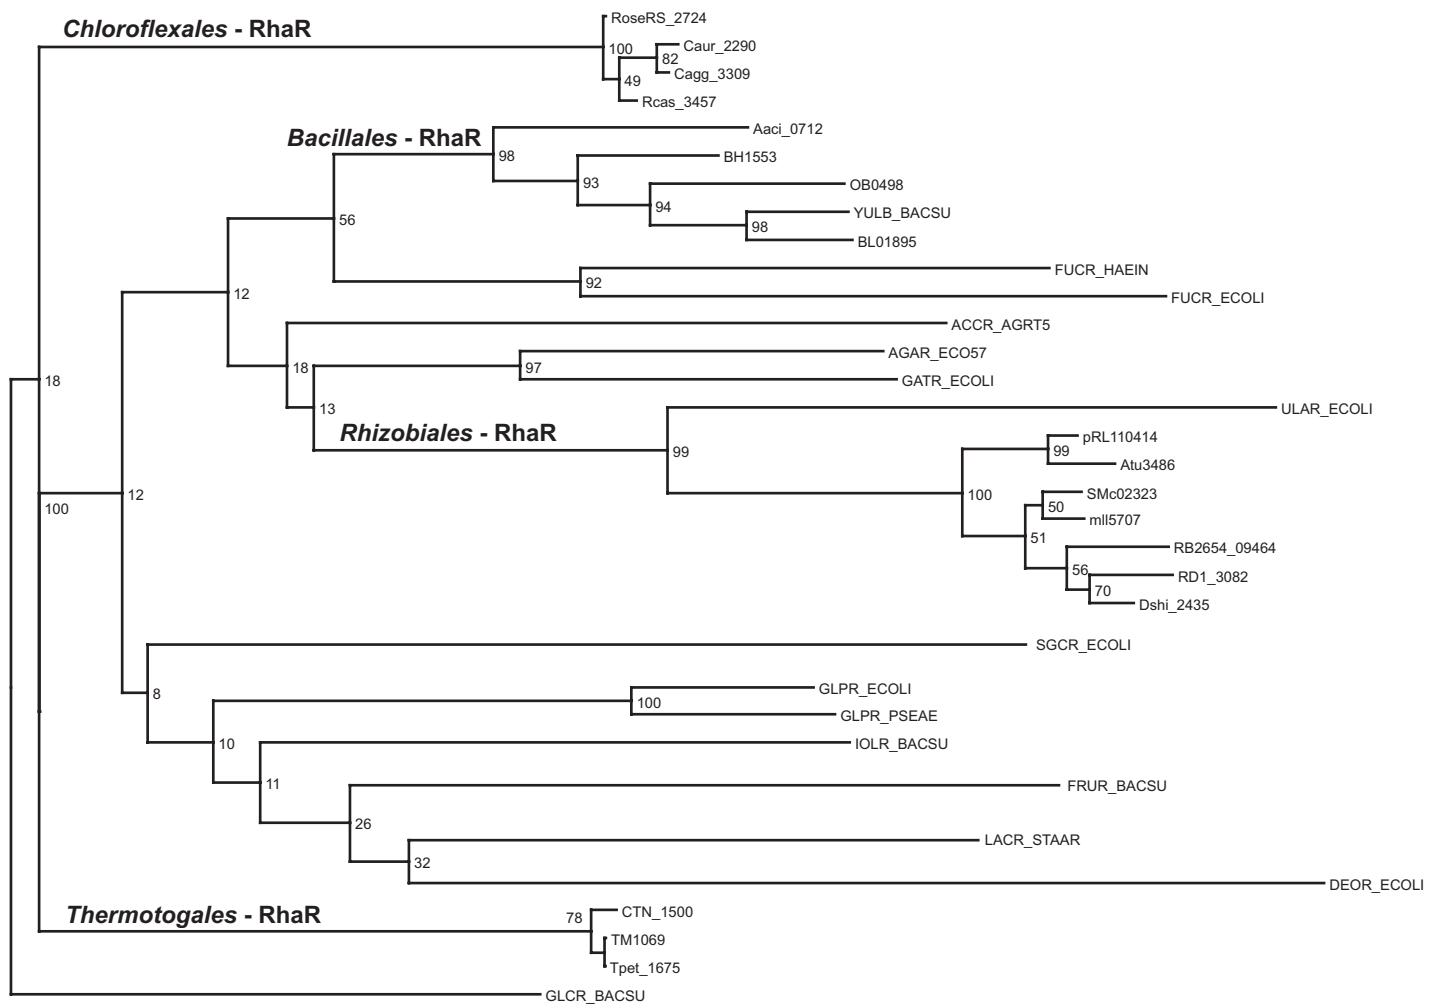

Figure S5. Maximum likelihood phylogenetic trees of transcriptional regulators for L-Rha catabolic pathways.
(A) DeoR-family transcription factors; **(B)** LacI-family transcriptional factors; **(C)** AraC-family transcriptional factors.

Phylogenetic trees were built using the PhyML server (<http://atgc.lirmm.fr/phylml/>) (Guindon et al., 2010) using the default parameters and the bootstrap values from 100 replicates. Phylogenograms were visualized with Dendroscope (Huson et al., 2007). Other previously characterized regulators from the same protein family were collected from UniPROT (<http://www.uniprot.org/>).

B. LacI family

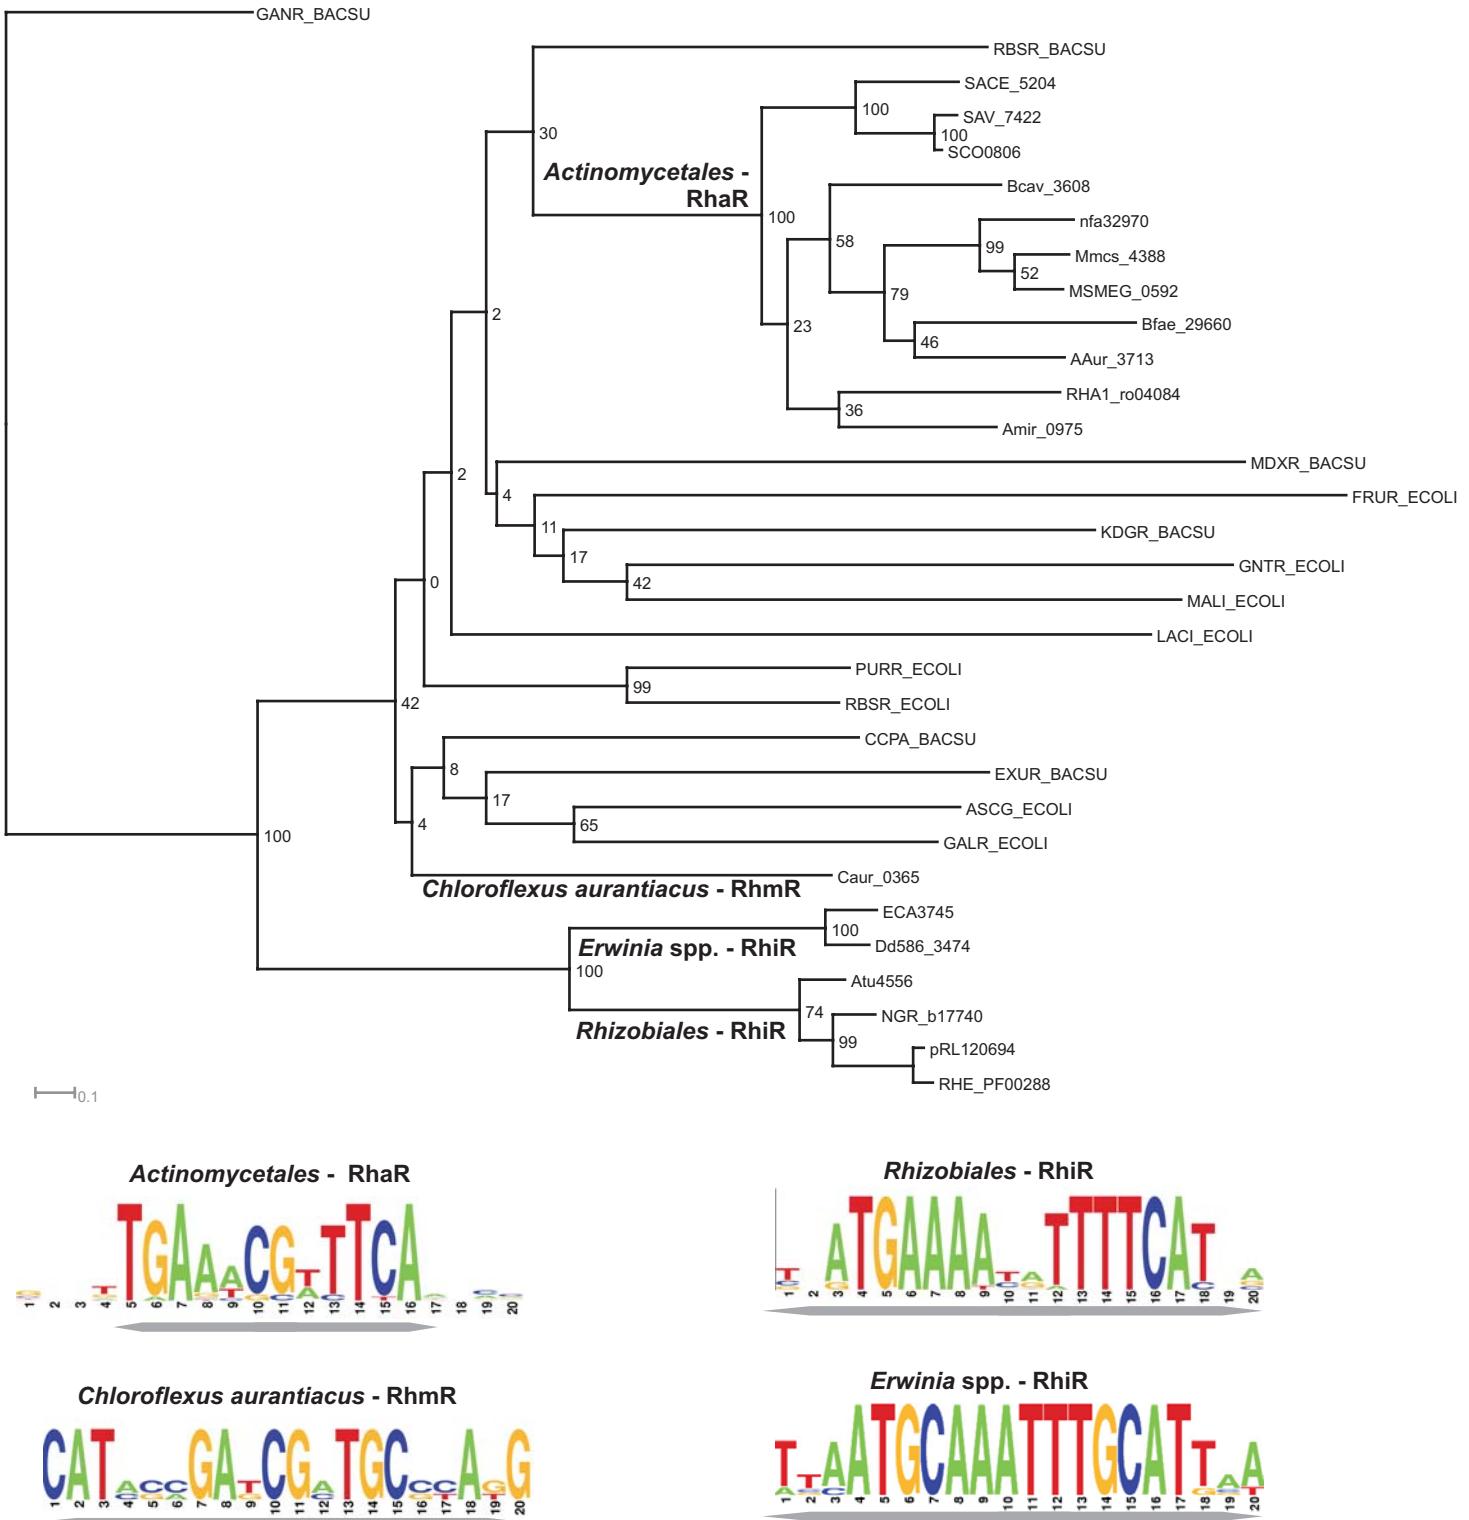

Figure S5. Maximum likelihood phylogenetic trees of transcriptional regulators for L-Rha catabolic pathways. (A) DeoR-family transcription factors; (B) LacI-family transcriptional factors; (C) AraC-family transcriptional factors.

Phylogenetic trees were built using the PhyML server (<http://atgc.lirmm.fr/phym/>) (Guindon et al., 2010) using the default parameters and the bootstrap values from 100 replicates. Phylogenograms were visualized with Dendroscope (Huson et al., 2007). Other previously characterized regulators from the same protein family were collected from UniPROT (<http://www.uniprot.org/>).

C. AraC family

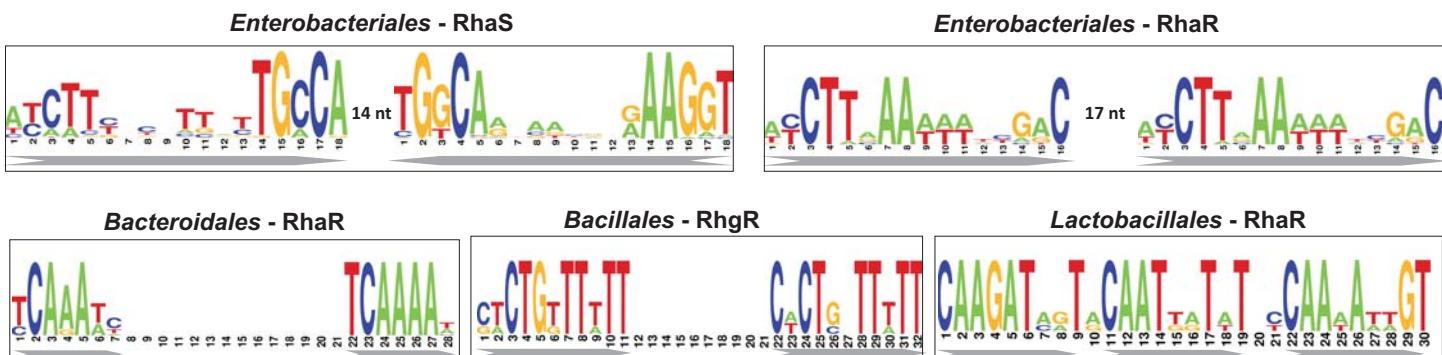

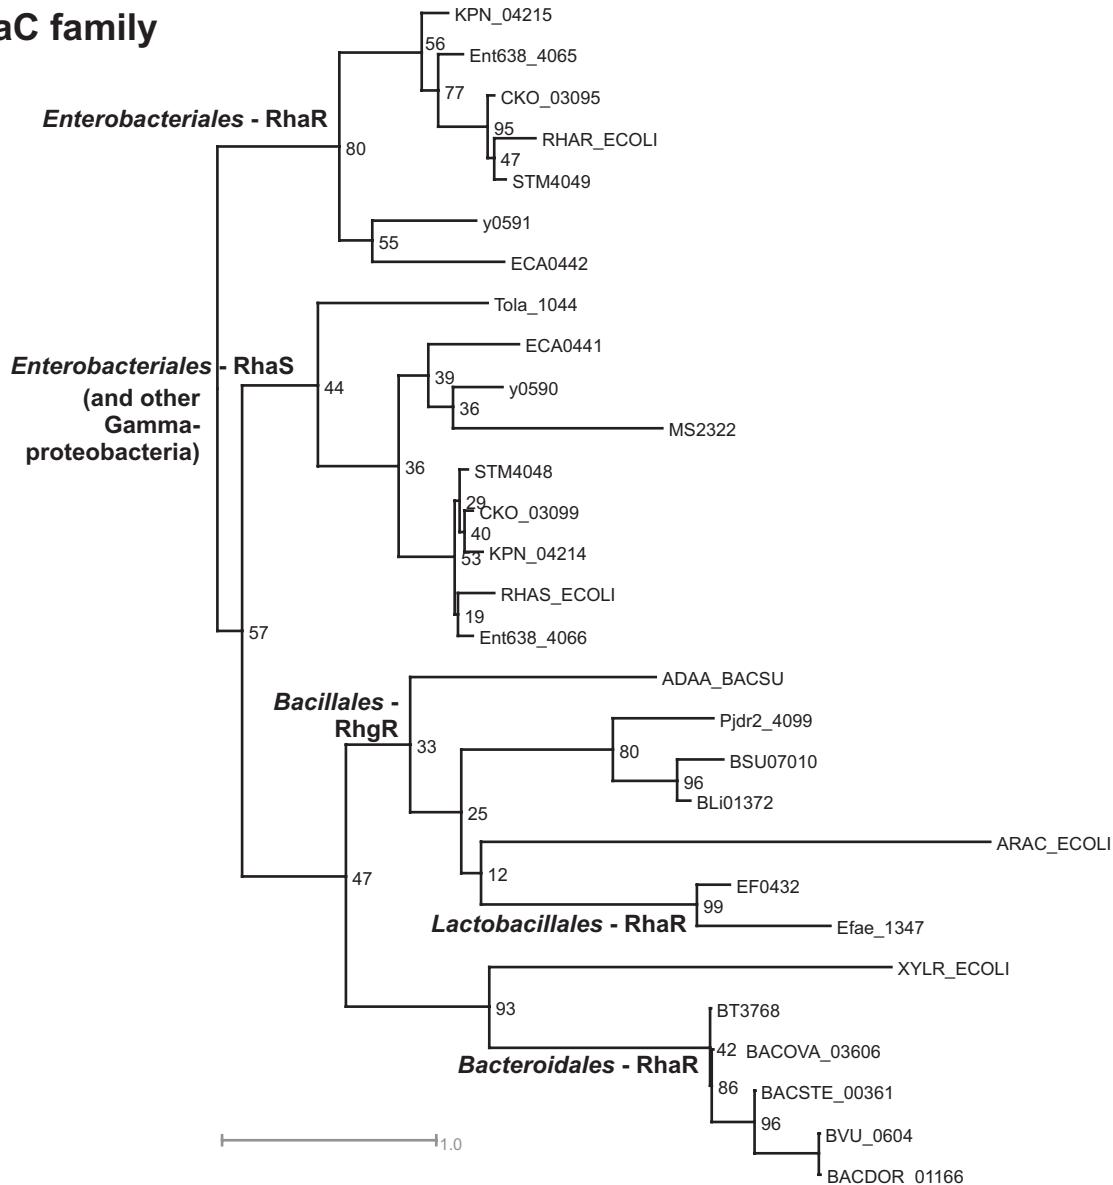

Figure S5. Maximum likelihood phylogenetic trees of transcriptional regulators for L-Rha catabolic pathways. (A) DeoR-family transcription factors; (B) LacI-family transcriptional factors; (C) AraC-family transcriptional factors.

Phylogenetic trees were built using the PhyML server (<http://atgc.lirmm.fr/phym/>) (Guindon et al., 2010) using the default parameters and the bootstrap values from 100 replicates. Phylogenograms were visualized with Dendroscope (Huson et al., 2007). Other previously characterized regulators from the same protein family were collected from UniPROT (<http://www.uniprot.org/>).
