

Table 1: Commonly deregulated genes in metastases related to ion homeostasis. Select genes are up- or down- regulated compared to the primary tumor or the host tissue in all or most of the target sites. On the basis of 653 metastasis-associated gene expression profiles in GEO (2), this table displays the genes pertaining to ion homeostasis. Those sets of genes seem to constitute essential mediators of metastasis, possibly conveying the ability to survive and expand in a non-cognate microenvironment. Genes different from the primary tumor may represent necessary contributors for metastasis initiation, while the genes that distinguish metastases from the target host site are likely reflective of metastasis outgrowth. **A)** Genes significantly up-regulated in the metastases over host tissue. **B)** Genes significantly down-regulated in the metastases compared to host tissue. Liver = li, peritoneum = pe, ovary = ov, lymph node = ln, adrenal = ad, bone = bo, lung = lu. **C)** Genes significantly up-regulated in the metastases over primary tumors. **D)** Genes significantly down-regulated in the metastases over primary tumors. Ovary = ov, breast = br, prostate = pr, kidney = ki, stomach = st, colon = co.

Gene symbol	Tissues of gene listed	# Tissues of gene listed	SD of each gene	Na	K	Ca	Mg	Mn	Fe	Zn	Cl	other
