

Supplementary Material

Manuscript- Life course tobacco smoking and risk of HPV-negative oral cancers in two countries

Model for imputing missing values in material deprivation index in HeNCe Life study Indian dataset

Material deprivation index was created as a sum of binary variables for 34 different amenities. Hence, the variable can be assumed to be a binomial variable with a trial size of 34. Age, sex, indicator variable for the interviewer, education (high vs low), area living (urban vs rural), year of birth, years lived at the place of birth, Lifetime maximum income, number of meals per day, cumulative exposure tobacco smoking (pack-years), cumulative exposure of alcohol (liters of ethanol), and cumulative exposure to betel quid chewing (chew-years) were used as predictors in the imputation model. Weekly informative priors were used for coefficients of all predictors. Code to fit BRLM with the imputation model is as follows:

```
model{
  #---variables-----
  # N = total sample size
  # ncon = number of confounders
  # ncon2 = number of predictors for imputation model
  # X = matrix of exposure measures in three periods
  # y = case-control status
  # conMat = matrix of confounders
  # mdi = material deprivation index
  # conMat2 = matrix of standardized covariates for imputation model (including intercept)
  #-----

#Likelihoods

  for(n in 1:N){

    #Analysis model
    logit(xb[n]) = alpha + delta*(X[n,1:pos[n]] %*% w[1:pos[n]]) +
      (conMat[n,1:ncon] %*% beta[1:ncon]) + beta[ncon+1]*mdi[n]

    y[n] ~ dbern(xb[n])

    #Model for imputation (Binomial model)
    logit(xb2[n]) = conMat2[n,1:ncon2] %*% gamma[1:ncon2]
    mdi[n] ~ dbin(xb2[n],34)
  }

#Priors for fixed effect

  alpha ~ dt(0,0.04,3)

  delta ~ dt(0,0.16,3)T(0,)

  beta[ncon+1] ~ dt(0,0.16,3)

  for(i in 1:ncon){
    beta[i] ~ dnorm(0,1)
  }

#Priors for imputation model (normal(0,1) & normal(0,5))
  gamma[1] ~ dnorm(0,0.04)
```

```

for(i in 2:ncon2){
  gamma[i] ~ dnorm(0,1)
}

#First age cohort has only two periods of exposures

w[1:t] ~ ddirch(p_alpha[1:t])

#Calculating ORs
OR = exp(delta)

#Hypoteses
hyp = (w[3] > w[1]) && (w[3] > w[2])
}

```
