

A Highly Sensitive and Selective Fluorescein-Based Cu²⁺ probe and Its Bioimaging in Cell

CONTENTS

1. Experimental

- 2. Spectroscopic properties of probe N4
- 3. MTT Assay
- 4.1H NMR, 13C NMR and MS spectra

1. Experimental

1.1 Synthesis of probe N4

Scheme S1 Synthesis route of probe N4

1.2 Cell culture experiments

MCF-7 cells were obtained from the Laboratory Center of Shaanxi Province People's Hospital. MCF-7 cells were grown on glass-bottom culture dishes using Dulbecco's Modified Eagle Medium (DMEM) supplemented with 10% (V/V) fetal bovine serum (FBS) and 50 μ g/mL penicillin-streptomycin at 37 °C in the humidified atmosphere with 5% CO₂ and 95% air. The growth medium was then removed and washed three times with FBS. The cells were pretreated with 20.0 μ M probe N4 for 30 min at 37 °C, washed with PBS (pH 7.4) twice and imaged. Then the cells were incubated with 20 μ M CuCl₂ for 30 min at 37 °C, washed with PBS (pH 7.4) twice and imaged.

FIGURE S2. Fluorescence responses of probe N4 (20 μ M) in the absence and presence of Cu²⁺ (20.0 μ M) with different pH conditions (λ ex = 440 nm).

3 MTT Assay

MCF-7 cells were seed in 96-well plates at density of 5000 cells/well. Plates were maintained at 37 °C in a 5% CO₂/ 95% air incubator for 24 hours. Then the culture medium in each well were replaced by fresh medium containing different concentrations of probe N4. After 24 hours treatment, into each well, 15.0 μ L MTT solutions (5.0 mg/mL in phosphate buffer solution) were added. After 4 hours incubation at 37 °C, the absorbance of each well at 440 nm was recorded by the Elx800 Absorbance Microplate Reader.
