**Table S1.** Parameters used to process the LC-HRMS data (mode + & mode -) with XCMS R package.

**Figure S1.** The classes of lipids and the percentage they represent of the background database used for the targeted identification of the lipids in the lipidome of the broilers from the pHu lines. PC = phosphatidylcholines, PE = phosphatidylethanolamines, PG = phosphatidylglycerols, PI = phosphatidylinositols, PS = phosphatidylserines, SM = sphingomyelins, TG = triacylglycerols, CE = cholesterol esters, Cer = ceramides, DG = diacylglycerols, GlcCer = glucosylceramides, LacCer = lactosylceramides, LPC = lysophosphatidylcholines, LPE = lysophosphatidylethanolamine, LPG = lysophosphatidylglycerols, MG = monoradylglycerols, PA = phosphatidic acid.

**Table S2. The 185 lipids identified in the serum of the broilers from the pHu line.** The importance of each lipids in the model (VIP) and their contributions to the pHu+ (negative values) or pHu- (positive values) line modelized by OPLS-DA (M1a; 1 predictive and 3 orthogonal components,  $R^2Y_{(cum)} = 0.74$  and  $Q^2_{(cum)} = 0.56$ ) were tabulated in the third and fourth column, respectively.

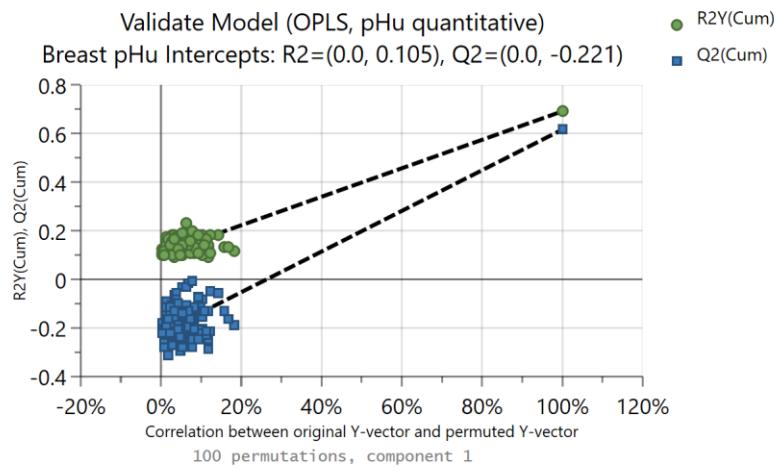

**Figure S2. Relation between pHu lines, total number of carbon atoms and degree of unsaturation of acyl chains of the lipids.** The importance of the lipids in the OPLS-DA model M1a (VIP) was represented by the size of the circle and the contribution to the pHu- or pHu+ lines was visualized through a gradient going from red (pHu-) to blue (pHu+). The characteristics of the M1a OPLS-DA model are 1 predictive and 3 orthogonal components,  $R^2Y_{(cum)} = 0.74$  and  $Q^2_{(cum)} = 0.56$ . Position jitter was introduced in the LPC and LPE plots to avoid overplotting.

**Figure S3. Permutation plot for the OPLS-DA model M1b (pHu lines).** The permutation plot check the validity and the degree of overfit for the model. The plot displays the correlation coefficient between the original y-variable (i.e. pHu+ or pHu-) and the permuted y-variable on the x-axis versus the cumulative  $R^2$  and  $Q^2$  on the y-axis, and draws the regression line. The intercept is a measure of the overfit.

**Figure S4. ROC curve external validation OPLS-DA model M1b (pHu lines).** The ROC curve is a tool for visualizing and summarizing the performance of classification and discrimination models. The plot displays the true positive classification rate (TPR) of a classifier model plotted against the corresponding false positive classification rate (FPR) at various threshold settings of the criterion parameter Y predicted. As a quantitative measure of the classification success the area under the ROC curve (AUC) is computed. This parameter ranges between 0.5 (bad classification) and 1.0 (perfect classification).

**Figure S5. Permutation plot for the OPLS model M4 (pHu value).** The permutation plot check the validity and the degree of overfit for the model. The plot displays the correlation coefficient between the original y-variable (i.e. pHu) and the permuted y-variable on the x-axis versus the cumulative  $R^2$  and  $Q^2$  on the y-axis, and draws the regression line. The intercept is a measure of the overfit.

**Table S3. Comparison between the lipid sets included in the model OPLS-DA predictive of the pHu lines (M1b) and the model OPLS predictive of the pHu value (M2).** The lipids were ordered according their importance in the model (VIP) and highlighted in red when they were present in both models.
