

Supplementary Materials

Supplementary Table 1. Source datasets in the Mendelian randomization study

Supplementary Table 2. Summary-level data associated with blood neurotransmitters and Alzheimer's disease

Supplementary Table 3. Summary-level data associated with blood neurotransmitters and Parkinson's disease

Supplementary Table 4. Summary-level data associated with blood neurotransmitters and amyotrophic lateral sclerosis

Supplementary Figure 1. Scatter plots in Mendelian randomization analyses of circulating glycine, glutamate and serotonin on three neurodegenerative diseases

Supplementary Figure 2. Leave-one-out plots in Mendelian randomization analyses of circulating glycine, glutamate and serotonin on three neurodegenerative diseases

Supplementary Table 1. Source datasets in the Mendelian randomization study

Note: For genetic variants (rs201393666, rs7979478, rs3753556) not available in the summary statistics of AD, proxied SNPs in linkage disequilibrium with them were utilized as bellows, rs149181595 ($r^2 = 1.00$), rs7970695 ($r^2 = 0.99$), rs3753555 ($r^2 = 1.00$), respectively.

Abbreviations: EA, effect allele; OA, other allele; SNP, single nucleotide polymorphism.

Abbreviations: EA, effect allele; OA, other allele; SNP, single nucleotide polymorphism.

Supplementary Figure 1. Scatter plots in Mendelian randomization analyses of circulating glycine, glutamate and serotonin on three neurodegenerative diseases. Overall causal estimates given by three MR methods, inverse-variance weighted, weighted median and MR-Egger were visualized using fitted lines with different colors. Instrumental SNPs were delineated with black solid points, with crossed horizontal and vertical gray lines depicting effect sizes for SNP-associations with neurotransmitters and neurodegenerative diseases, respectively. AD, Alzheimer's disease; ALS, amyotrophic lateral sclerosis; MR, Mendelian randomization; PD, Parkinson's disease; SNP, single nucleotide polymorphism.

Supplementary Figure 2. Leave-one-out plots in Mendelian randomization analyses of circulating glycine, glutamate and serotonin on three neurodegenerative diseases. Leave-one-out plots depicted overall effect estimates given by the inverse-variance weighted MR with each individual SNP excluded out of the instrumental variable set in turn. Causal effect sizes underwent natural logarithm transformation, and point estimates were shown with solid circles, whereas 95% confidence intervals were illustrated with horizontal lines through them. Vertical dashed lines represented null effects, and the left and right parts indicated the protective and deleterious effects of circulating neurotransmitters on neurodegenerative diseases, respectively. There was no evidence for the existence of heterogenous variables, which would otherwise disproportionately drove the overall effects. AD, Alzheimer's disease; ALS, amyotrophic lateral sclerosis; MR, Mendelian randomization; PD, Parkinson's disease; SNP, single nucleotide polymorphism.
