

Supplementary Figure 1. Kinetics of embryo development. Timings are approximate estimates of *in vivo* events. Development stages at different times will vary by embryo and individual dam. Pink arrows denote events occurring in the oviduct; green and blue arrows denote events in the uterine horns. LH, luteinizing hormone.

a) Dog (1-5)

b) Cat (6, 7)

Supplementary Table 1. Overview of organogenesis and early development in dogs for selected organs. D, day; Mth, month; Wk, week; Yr, year.

Period	Immune system	Cardiovascular & musculoskeletal system	Reproductive organs	Pituitary and adrenal glands and pancreas	Gut	Brain, neuroendocrine system, vision
						
Embryo Day 19–35 	• D27–28: Primordia of spleen and thymus evident (1)	• D21–22: Primordial heart apparent (2) • D21–24: Heart beat first visible (3) • D22–25: Early development of limbs (2) • D28: First ossification of skeleton observed (4)	• D22: Primordial germ cells detected in gonadal ridge (5) • D22: Global DNA demethylation occurs in the male canine gonadal ridge (6) • D21–25: Gonads remain undifferentiated (4)	• D25: Adeno-hypophysis first identifiable (7) • D27: Primordial adrenal glands appear (7) • D30: Pancreatic cells first detected – insulin +ve β-cells and α-cells (7)	• D22–25: Primitive gut established (2)	• D22–25: Brain vesicles (forebrain, midbrain and hind brain) have formed (2) • D25–28: Retinal precursor formed (8) • D29–32: Primitive brain still developing (2)
Fetus Day 35 to birth 	• D35–40: Thymus actively lymphopoietic (1) • D45: Thymus microenvironment complete (1, 9) • D45–52: Lymphocytes infiltrate lymph nodes (1) • D45: Lymphocytes respond to mitogen (1, 9) • D50: Thymocytes can respond to mitogen (1, 9) • D45–52: Abundant hemopoietic stem cells in bone marrow (1) • D45–55: Peyer's patches present in small intestine (1)	• D35: Complete cardiovascular system apparent (2) • D57: Last bones ossify (4)	• D35–40: Sex differentiation begins (5) • Prespermatogonia present before birth (6)	• D38: Pituitary gland has same morphology as in adult dog (10)	• D44+: Differentiation of layers in gut wall detectable by ultrasound (11)	• D35: Metencephalon, optical source bridge and cerebellum forming (2) • D35: Myelencephalon starting to form oblong medulla (2)

Supplementary Table 1 continued

Birth to 8 weeks Timings relative to birth 	• At birth: Blood concentration of maternally derived antibodies close to zero (1, 12) • At birth: functionally mature Peyer's patches (1) • At birth a functional B and T cell system present (1) • Day 1: Immunocompetent (post vaccination kinetics of antibodies similar to older puppies) (13) • Days 0–21: Marked changes in proportions of different lymphocyte subsets (14) (12)	• D18–21: Walking commences and is co-ordinated by D28 (15) • Wk 4–6: Pronounced change from developmental to adult isoforms of myosin heavy chain in skeletal muscles (16)	• At birth: Ovary contains oogonia, but no follicles (17) • Wk 2–3: First primordial follicles (17) • Mth2: Germinal cells degenerated (female) (17) • Wk 1: Uterine adenogenesis underway and prepubertal glandular proliferation complete by Wk6 (18)	• At birth: Adrenal capsule elements present but poorly demarcated (19) • Wk8: global organization of pancreatic tissue mature (20) • Wk8: Ratio of $\alpha:\beta$ cells is still less than in the adult (20) • By Mth1: in adrenal gland demarcation between capsule and cortex evident and 3 cortical zones well defined (19)	• 16–24 hours: Gut closes to absorption of immunoglobulins (21) • D1: GI tract colonized— aerotolerant bacteria dominant. Anaerobic bacteria subsequently increase in number and proportion (22) • Wk 8: Microbiome changes significantly with age at least to Wk8 (23, 24)	• D16–36: Photoreceptors develop (8) • Birth–Wk3: First cycle of postnatal myelination of spinal cord (26) • Wk4: Autonomic thermoregulation (15) • By Wk4–5: Conditioned reflexes of vision and audition (26) • By Wk6: Second cycle of postnatal myelination (26) • By Wk6: Neuronal development of sensory, motor, visual and auditory cortex relatively mature (26) • Wk6: Brainstem and cerebellum have adult appearances (25) • Wk8: Retina is mature (8)
Post weaning Timings relative to birth 	• Beyond Yr1: Proportion of lymphocyte populations continue to change (1) • Mth2–3: Serum IgM levels attain adult levels (1) • Mth6–9: Serum IgG levels approximate to adult levels (1) • Mth12: Serum IgA levels attain adult levels (1) • By Yr1: Serum immunoglobulin levels believed to reach adult values (12) • Mth6–23: Thymus involution (12)	• By Mth2: Maturation of skeletal muscle fibres in terms of transition to adult myosin heavy chain isoforms nearly complete (16) • Up to Yr2: Growth plates continue to close until up to 24 months (27)	• Mth4: Primary or early preantral follicles (6) • Mth4 to Mth 5–6: Early antral follicles observed (6) • Mth 6 onwards: Advanced antral follicles (6) • ~Mth7: Spermatogenesis starts (~60-day cycles) (5)	• Up to Yr1: Marked morphological changes continue in adrenal gland (19) • Age-related changes in chymotrypsin and amylase activity of pancreatic tissue apparent until adulthood (28)	• By Wk6: Greatest changes in gut microbiome have occurred (24) but changes still evident during Yr1 {You, 2021 #559} • Gastric pepsin activity increases between D63 and adulthood (28) • Apparent macronutrient digestibility increases until the end of growth (30)	• Learned responses such as delayed response develop after Wk8 (26) • Wk 16: Corpus callosum and cerebrum have adult appearances (25) • Neocortex myelination continues until ~Mth9 (26)

Supplementary Table 2. Overview of organogenesis and early development in cats for selected organs. D, day; Mth, month; Wk, week; Yr, year.

Period	Immune system	Cardiovascular & musculoskeletal system	Reproductive organs	Pituitary and adrenal glands and pancreas	Gut	Brain, neuroendocrine system, vision
						
Embryo Day 19–35 	• D25: Lymphocytes in circulation (1) • D25: Lymphocytes in circulation (1) • D28–32: Lymphocytes scattered in developing lymph nodes (2) • D32–38: First lymphoblasts in thymus (2)	• D18–19: Limb buds appear (2) • D21: Primordial heart apparent (3) • D22–25: Early development of limbs (3) • D25–28: Lower limb starts perichondral ossification (2)	• D19–21: Genital ridge ventromedial of mesonephros (2) • By Day 32: Testes and ovary are differentiated (2)	• D19–21: Pancreas primordia distinct (2) • D23–25: Adrenal glands are differentiating (2) • (2)D25–28: Adrenals produce corticoids (2) • D25–28: Pancreas differentiates (2) • D28–32: Adrenal cortex and medulla separated (2) • D32–38: First pancreas islets (2)	• 16 hours: Immunoglobulin absorption stops (1) • D22–25: Primitive gut established (3) • D25–28: Gastric glands and intestinal villi form (2)	• D22–25: Brain vesicles (forebrain, midbrain and hind brain) formed (3)
Fetus Day 35 to birth 		• D32: Complete cardiovascular system apparent (3) • D34–38: skeletal muscle spindles have single primary myotubes with simple innervation (4)	• D38–44: Genitals are differentiated (2)			

Supplementary Table 2 continued

Birth to 8 weeks Timings relative to birth 	• At birth: Blood concentration of maternally derived antibodies close to zero (1, 5) • At birth: Inability to mount substantial immune response to antigen (6) • Wk6–12: Immunocompetence considered to be achieved but depends upon colostrum immunoglobulins ingested (1) • D1 to at least Mth 3: proportions of some lymphocyte subsets change in serum, thymus and lymph nodes (6)	• By birth: Assembly of extra- and intrafusal skeletal muscle fibres (4) • ~D31: Adequate standing and imperfect walking (7) • ~D44: Normal walking and running (7)	• ~Mth 1: First primordial follicles appear (8)			• Birth–Mth3: All neurological functions mature progressively (7) • D8–13: Spatial localization of auditory stimuli starts and complete by D12–20 (7) • D10–15: Interactions with siblings, mother and/or objects, and play start (7) • Day 26: Visual orienting observed (7) • D30: Volumes of the neocortex, caudate nucleus, thalamus and substantia nigra are within adult ranges (9, 10) • D47–83: Binocular coordination complete (7) • D60: Volume of the red nucleus is within adult range (9) • D70: Peak synaptic density in the visual cortex followed by significant decline (11)
---	--	---	---	--	--	--

Post weaning Timings relative to birth 	• Lymphocyte populations continue to change (6) • Mth5–9: Secretory IgA from bile reaches adult levels (12) • Mth 5+: Serum IgA reaches adult levels after Mth5 (13) • Mth6–8: thymus starts to involute (1)				• By Wk 30–42: Gut microbiome has stabilized (14)	• Mth6: Volume of telencephalic white matter is close to adult volume (10) • Mth3: Cerebral protein synthesis peaks in some brain regions (15) • Mth6: local cerebral metabolic rate for glucose stabilizes to adult level (16)
---	---	--	--	--	---	---
