### A Commentary on

## Identification of IFN-Induced Transmembrane Protein 1 With Prognostic Value in Pancreatic Cancer Using Network Module-Based Analysis

By Wu L, Zhu X, Yan D, Tang M, Ma C and Yan S (2021). *Front. Oncol.* 11:626883. doi: 10.3389/fonc.2021.626883

The human interferon (IFN)-induced transmembrane protein 1 (IFITM1), also called Leu13 or CD225, is a 17-kDa cell-surface membrane protein in the IFN-stimulated genes (ISGs) protein family (1). IFITM1 was initially identified as a leukocyte membrane surface antigen involving in signal transduction in lymphocytes, such as antiproliferative and homotypic adhesion signaling (2, 3). Additionally, IFITM1 was regarded as a modulator of immunity and antiviral activity (1). Recently, with great interest we read a study “Identification of IFN-Induced Transmembrane Protein 1 With Prognostic Value in Pancreatic Cancer Using Network Module-Based Analysis” in *Frontiers in Oncology* (4), revealing that the expression level of IFITM1 was increased in pancreatic cancer. Patients with IFITM1 overexpression had poor survival, and IFITM1 was one of the independent prognostic factors for overall survival. Moreover, down-regulation of IFITM1 significantly suppressed the tumorigenicity of pancreatic cancer cells (4). In addition, increasing evidence have demonstrated that IFITM1 was also upregulated in numerous tumor tissues as well as cancer cell lines, such as colorectal cancer (5), gastroesophageal adenocarcinoma (6), gastric cancer (7, 8), hepatocellular carcinoma (9), lung cancer (10), breast cancer (11, 12), head and neck cancer (13, 14), gallbladder carcinoma (15), ovarian cancer (16), glioma (17), and nasopharyngeal carcinoma (18). Overexpression of IFITM1 enhanced cell proliferation, invasion, metastasis, angiogenesis, and therapeutic resistance, including endocrine therapy, chemotherapy, and

radiotherapy resistance of tumors. Mechanically, IFITM1 exerted cancer-promoting effects through regulating several pathways, including EGFR/SOX2 (10), JAK/STAT (11), and CAV-1 (19). These findings suggest that pharmacological or genetic inhibition of IFITM1 maybe a potential and novel therapeutic approach for tumors.
