A corrigendum on

Firing clamp: a novel method for single-trial estimation of excitatory and inhibitory synaptic neuronal conductances

by Chizhov, A. V., Malinina, E., Druzin, M., Graham, L. J., and Johansson, S. (2014). *Front. Cell. Neurosci.* 8:86. doi: 10.3389/fncel.2014.00086

It is important to note that Bédard and colleagues have also described a method for the single trial extraction of synaptic input (Bédard et al., 2012). This method, which requires that the membrane voltage remains subthreshold, thus in a linear

domain, obtains an estimate for synaptic inputs based on time derivatives of passive recordings of the membrane voltage trace, i.e., without perturbations from injected current by the amplifier.
