A Corrigendum on

A Novel Mechanism of Carvedilol Efficacy for Rosacea Treatment: Toll-Like Receptor 2 Inhibition in Macrophages

By Zhang J, Jiang P, Sheng L, Liu Y, Liu Y, Li M, Tao M, Hu L, Wang X, Yang Y, Xu Y and Liu W (2021). *Front. Immunol.* 12:609615. doi: 10.3389/fimmu.2021.609615

In the original article, there was a mistake in **Figure 1** as published. In **Figure 1A**, the y-axis of the top graph was labelled “CD68 staining score”, when it should have been labelled “TLR2 staining score”. The corrected **Figure 1** appears below.

The authors apologize for this error and state that this does not change the scientific conclusions of the article in any way. The original article has been updated.

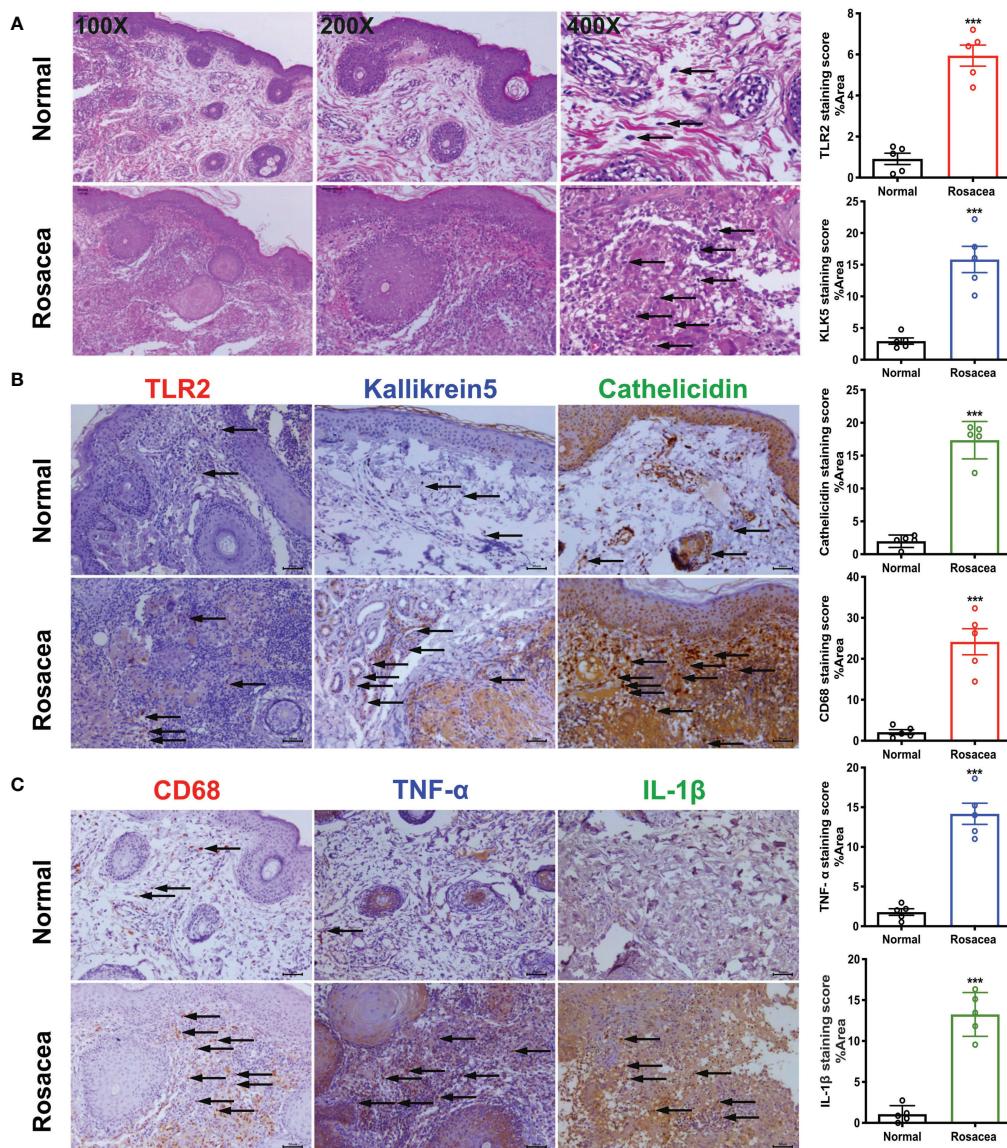

FIGURE 1 | Inflammatory cells especially macrophages are abundant in rosacea skin, together with cathelicidin. The skin lesions ($n = 5$) of individuals with rosacea were biopsied and embedded into wax blocks. **(A)** Profound accumulation of inflammatory cells can be observed in the skin samples stained by HE. The pictures were taken under $\times 100$, $\times 200$, and $\times 400$ magnification. **(B)** TLR2, KLK5, and cathelicidin are abundant in lesional skin of individuals with rosacea as detected by immunochemical staining; the pictures were taken under $\times 200$ magnification. **(C)** Macrophages in lesional skin of individuals with rosacea as examined by immunohistochemistry with an antibody against CD68, and inflammatory reactions determined by staining with antibodies against TNF- α and IL-1 β . The pictures were taken under $\times 200$ magnification; *** $P < 0.001$ ($n = 5$).
